*Relax! Automate Everything*

## Automate Everything With Scripting You Can Trust

IPeople Script's intuitive wizards allow you to automate the script-writing process and eliminate the manual typing of data into your HCIS system. Both technical and non-technical users will find benefit from IPeople Script's object-oriented scripting approach and flexible script-building features such as drill-down capabilities, auto-recovery, and alert notifications. IPeople Script can work with other applications. In addition, it includes the ability to perform real-time queries against your HCIS system and other data sources, and supports the simultaneous running of scripts for supported platforms.

### One Solution For Your Many Needs

We understand that you have many systems and need to integrate the data, which can result in costly interfaces. Free time and costs by automating processes and data entry through IPeople Script. Our solution supports all MEDITECH platforms, including full support for MEDITECH 6.1, and other applications. The solution was inspired and evolved over the years by the needs of our users to provide a simple and reliable automation solution.

### Eliminate Timing Issues & Minimize Upgrade Concerns

Eliminate timing issues, easily support HCIS errors, and minimize upgrade concerns with our intuitive and smarter scripting approach. Through an object-oriented scripting approach that allows you to base logic on name rather than the location of fields, you no longer need to apply unnecessary logic for supporting timing issues. In addition, rest easy knowing that few, if any, changes are needed upon receiving an HCIS upgrade.

### Auto-recovery and Alert-Notifications

Take advantage of alert notifications, intelligent auto recovery, and auditing so that you can relax and let the solution reliably do the work for you. Apply notifications so that you always know first if an issue is ever encountered. In addition, logging features are available providing visibility with every step. This includes logging the success and failure status for every record processed.

### Reporting & Scheduling

Take advantage of the built-in report features to see the success and failure status for every record processed or view records in queue. In addition, the solution includes flexible scheduling options to automate script execution. Schedule jobs to run on a specific day and/or time or schedule jobs to run throughout the day at a regular interval.

### HOW YOU WILL SUCCEED

- ✓ Automate processes to free up resources, saving both time and money
- ✓ Enjoy a worry free day knowing your scripts are reliable with intelligent auto-recovery and alert-notification
- ✓ Perform real-time queries against your HCIS system

## HEAR IT FROM THE CUSTOMERS

*"IPeople Script allowed us to pull over the additional data we needed as well as continue all of our day to day tasks and special cases. We easily wrote a ton of scripts to map data into the new 6.0 fields saving us a lot of manual keying effort. The conversion was much easier with IPeople Script. We could go over to Magic, grab data and script it into 6.0."*

*-Brandon Tolleson, Arkansas Children's*

*"I love the IPeople software. I can always trust my scripts to run without babysitting them. It's just fire and forget."*

*-Randy Romanoff, Asante Ashland Community Hospital*

*"Using the IPeople Script product has given us the ability to assign and track deficiencies electronically. IPeople Script has been a great product that is filling a need, both cost effectively and efficiently".*

*- Steve Curry, Princeton Community Hospital*

*"We were in need of a way to quickly migrate our inpatient's orders, nursing interventions and medications from an old account to a new re-admit account. Our facility is a bit unique as we do not have Meditech's long term care product. We are using ADM inpatient accounts which are more acute based. Once discharged, the orders, nursing interventions and medications are d/c'd. Our patients have a large number of these items. On average 125-150 orders, 40-50 nursing interventions and 30-40 medications and the process was taking on average of about 2-3 hours per patient with the rate of 1-3 patients per week. Our average census is 40 patients. We needed some sort of automation to help alleviate the manual input process. IPeople stepped in to provide the script to help move the information over for us. The 1st go round was to help us meet the ICD10 deadline of October 1st, 2015. It allowed us to discharge all 40 of our patient's at once and populate all the accounts in one session to avoid dual coding those accounts for long periods of time."*

*- Timothy Rogers, Children's Hospital of Richmond at VCU*

## IPEOPLE SCRIPT FEATURES

- Script Director for managing all scripts
- Object oriented logic reducing timing concerns and the need for additional logic
- Script Wizard for defining logic for field and window objects
- Script Maker for defining on got focus and on lost focus logic
- Mapping features for easy mapping of values, fields, and windows
- Search features
- Global routines for centralized script logic
- Auto-recovery and alert-notification features
- Scheduler for script automation
- Ability to perform direct and real-time queries against your HCIS system in support of your scripts
- Recorder for fast script creation
- Built-in logging and reporting
- Scheduler monitoring to view scheduled scripts from any location
